This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin for portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 86 novell genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Dased on which tissues are described for each of the
                                                                                                                                                                                                                              Ni J;
                                                                                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

Bone marrow secreted protein; bone marrow stromal cell; cytokine; cell proliferation; cell differentiation; hematopoiesis; anaemia; myeloid cell deficiency; lymphoid cell deficiency; lymphoid cell deficiency; lymphoid cell deficiency; granulocyte; morophage; myelo: colony stimulating factor; granulocyte; monocyte; macrophage; myelo-suppression; megakaryocyte; platelet; platelet disorder; thrombocytopenia; hematopoeitic stem cell; stem cell disorder; aplastic anaemia; bone differentiation; paroxysmal nocturnal hemoglobinuria; bone growth; cartilage; tendon; ligament; nerve; wound healing; tissue repair; burn; incision; ulcer; bone fracture; cartilage damage; artificial joint; ss. cDNA encoding a bone marrow secreted protein designated BMS112.

```
Excessory sector bound marrow sectored processing of the proteins can exhibit cytokine, cell proliferation, or strongl cells. The proteins can exhibit cytokine, cell proliferation, or cell differentiation activity (either inducing or inhibiting). They can be used to support colony forming cells or factor-dependent cell lines, to regulate hematopoiesis, and to treat myeloid or lymphoid cell lines, to proliferation of erythroid progenitor cells, and to treat various anaemias. They can have colony stimulating factor (CSF) activity and can be used to support the growth and proliferation of megakaryocytes and platelets, thereby allowing prowntion or treatment of platelet disorders such as thrombocytopenia, to support the growth and proliferation of megakaryocytes and platelets, thereby allowing prevention or treatment of platelet disorders such as thrombocytopenia, to support the growth and proliferation of hematopoeitic stem cells, either in place of or in conjunction with platelet transfusions, to treat stem cell disorders, such as aplastic anaemia and paroxysmal nocturnal hemoglobinuria, or to repopulate the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bour cartilage. Compute the stem cell compartment after irradiation or chemotherapy. They can be used for growth or differentiation of bour cannot healing and tissue repair and replacement, and in the treatment of burns, incisions can ulcers, to induce cartilage and/or bone growth in circumstances where be not normally formed and thus have an application in healing bone fractures and cartilage damage or defects, prophylactic use in fracture caucition and also in the improved fixation of artificial joints
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ36228-49 encode bone marrow secreted proteins of human bone marrow

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Ruben SM, Komatsoulis GA;

WPI; 2001-367020/38. P-PSDB; AAE03939. Nucleic acids encoding 50 human secreted polypeptides, useful for preventing, diagnosing and/or treating diseases, e.g. Parkinson's disease, botulism, cancers and Scimitar syndrome.

Claim 1; Page 520; 614pp; English.

AAD08345-AAD08394 represent cDNAs corresponding to 50 human secreted protein genes and AAE03998-AAE03947 represent the protein steps encode. AAE03996 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the conversion of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 50 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, connected disorders, schizophrenia, asthma, skin disorders (e.g., rheumatoid arthritis), inflammation, allergies, connitive disorders, schizophrenia, asthma, skin disorders (e.g., angiogenic disorders, altered schizophrenia, anthritian disorders, angiogenic disorders, indoction asthma, skin disorders, angiogenic disorders, indoction asthma, skin disorders, angiogenic disorders, and sorders, and sorders, angiogenic disorders, and sorders, and sorders, proteins can also be used to aid wound healing and epithelial call proliferation, to prevent skin aging due to surburn, to maintain organs to regenerate tissues, to identify their cognate ligands or binding to regenerate tissues, and can be used as a food additive or

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the prosect of the full length human cDNA of the invention. Note: The sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primers useful for synthesizing full length cDNA clones and their use

Human secreted protein gene 27 SEQ ID NO:37.

셤 ઠ

```
This invention relates to a novel primers useful for synthesising full length CDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, encoding proteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.

The polymucleotide sequences given in AAP32699 to AAF32747 encode the human secreted proteins given in AAB64422 to AAB64470. AAB64471 to AAB64471 to AAB64458 represent human secreted polypeptide sequences and proteins howologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues cand cells the genes are expressed in. Examples of activities include: antiarthritic; immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; creebroprotective; nootropic; cardiant; vasotropic; creebroprotective; nootropic; creebroprotective; notroprotective; antibacterial; virucide; fungicide; and optimal polymucleotides and polymptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to pathological condition. Disorders or susceptibility to a also used autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative catiac arrest, creebrovascular disorders e.g. cardiac arrest, creebrovascular disorders e.g. cardiac arrest, creebrovascular disorders e.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound chaing and epithalial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting colluture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAF32690 to AAF32690 and AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF32690 to AAF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Homo sapiens.
                                                                          08-AUG-2002
The invention relates to a method of detecting an autoimmune disorder in a subject comprising obtaining a biological sample, preferably a peripheral blood mononuclear cell, from a subject, determining expression levels of at least two genes in the biological sample, and comparing the expression level of each gene ermined with a standard, where the comparison detects the presence of an autoimmune disorder in the subject. The method is useful for detecting or diagnosing an autoimmune disorder, e.g. rheumatoid arthritis, systemic lupus erythematosus, multiple solerosis, or type 1 (insulin-dependent) diabetes. The present sequence represents one of seventy genes used to detect autoimmune disorders with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting an autoimmune disorder in a subject comprising comparing the expression level of each gene determined with a standard, where the comparing detects the presence of an autoimmune disorder in the subject.
                                                                                                                                                                                                       gene; ss; autoimmune disorder; peripheral blood mononuclear cell; rheumatoid arthritis; systemic lupus erythematosus; multiple sclerosis; type 1 (insulin-dependent) diabetes; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 24; DB 12; Length 1785; 79.2%; Pred. cancer.

```
The invention relates to an isolated polymucleotide (I) comprising: (a)

any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b)

camplements of (a); (c) sequences consisting of at least 20 contiguous

complements of (a); (d) sequences that hybridize to (a), under moderately

cresidues of (a); (d) sequences having at least 75 or 90% identity

cresidues of (a); (d) sequences having at least 75 or 90% identity

cresidues of (a); (l) and oligonucleotides (ABP66596-

couls expressing the oligonucleotides, polymucleotides,

antibodies, fusion proteins, T cell populations and antigen presenting

calls expressing the polypeptide are useful in treating pancreatic cancer

and stimulating an immune response. The polymucleotides can be used as

probes or primers for nucleic acid hybridisation, in the design and

probes or primers for nuclein and thybridisation, in the design and

probes or primers for nuclein and the tumour cells, in vaccines and for gene

conference of therapy. Note: The sequence data for this patent did not form part of the

conference of the capanish of the tumour cells, man and the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the conference of the c

U1-E-E01 is a normalized cDNA library containing the following tissue(s): fetal eye. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1966. First strand cDNA synthesis was primed with an oilgo-dr prime containing a synthesis was primed with an oilgo-dr prime containing a hot I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector: The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGGTATACC: This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

/foloe="Upercor: pDNR-CL1B; Site_1: Sfil (ggccattatggcc);
Site_2: Sfil (ggccgctcggcc); Double-stranded cDNA was prepared from a pool of 40 cell line polyA+ RNAs (bladder-2%, blood -33.4%, brain -5.6%, breast -12.5%, colon-4%, connective tissue -1.4%, eye -1%, incestine -2.6%, kidney -2.2% liver -5.7%, lung -10.8%, NK-cell -5.2%, connective tissue -1.3%, prostate -4.3%, salivary gland -1.3%, and skin -2.3%). S' and 3' adaptors were used in cloning as follows:
5'-AAGCGGGGACGGCGCGCGACATACGGCGGG-3' and 5'-AAGCGGGGCGCGCGCGCCAATAGGT (30) NN-3'. Full-length enriched library was constructed using the Clontech Creator SMART kit and size-selected to contain the 0.2-0.5 kb size fraction (other fractions present in NIH MGC 142). Library created in the laboratory of M. Brownsteln (NIMH, NIH). Note: this is a NIH_MGC Library."

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from menroendoorine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Patima Bonaldo. "

/note="Organ: kidney; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site=1: Not 1; Site=2: ECo R1;
Plasmid DNA from the normalized library NCT CGAP Kid3 was
prepared, and so circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(cloneIDs 13223/6-1323911, 1456007-1456775, and
1500552-1502855). Subtraction by Bento Soares and M.
Fatima Bonaldo. "

//note="Organ: Lung; Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site_1: ECR I; Site_2: Not I;

NCI_CGAP_FTI is a normalized CDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages explailenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryotz, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

US-09-949-016-31983/C

Sequence 31383, Application US/09949016

Patent No. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REFERENCE: CL001307

CURRENT PILING DATE: 2000-00-41,755

PRIOR PILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-00-09

PRIOR FILING DATE: 2000-00-09

NUMBER OF SEQ ID NOS: 207012

SEQTYMARE: FastSEQ for Windows Version 4.0

SEQ ID NO 31983

Sequence 16654, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
PAPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
PILE REPERENCE: CLOOD 307

CURRENT APPLICATION NUMBER: 60/241,755

PRIOR PLLING DATE: 2000-010-03

PRIOR PLLING DATE: 2000-10-03

PRIOR PLLING DATE: 2000-10-03

PRIOR PLLING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOOTHARE: FastSEQ for Windows Version 4.0

SEQ ID NO 16654

LENGTH: 64593

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description

                                The present invention describes a human stress-phosphorylated endoplasmic reticulum protein, designated Nogo B. Nogo B has cycostatic activity and is a modulator of the storage and exchange of calcium, cell growth and cellular stress response. It can: regulate oxidative stress; inhibit neutrite outgrowth, neuron growth and axon regeneration. Nogo B polypeptides and polymorlocides are useful for modulating stress levels and cellular stress-response, cell growth and viability, diagnosis and treatment of cancer, malignant growth and other Nogo B related diseases. Nogo B polypeptides are also useful to screen combinatorial libraries to identify agonist or antagonist. Antibodies against Nogo B polypeptides are useful for affinity chromatography and distinguishing Nogo B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, ss, antisense therapy, cytostatic, antiinflammatory, haemostatic, cerebroprotective, nootropic, neuroprotective, antiparkinsonian, muscular, CD20, neurite growth inhibitor gene, NOGO, hammerhead ribozyme, DNAzyme; inozyme, G-cleaver; amberzyme; zinzyme; lymphoma, leukaemia; B-cell lymphoma, non-Hodgkin's lymphoma, NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma;

```

```
The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down corresponded to a cD20 gene and a nucleic acid molecule which down corresponded to a repression of a neurite growth inhibitor gene (NGCO). The nucleic acids and NCH motif), a G-cleaver (cleaving RNA with a NNM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NCH with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA correspond to the cell and treat a patient having a condition associated with the level of CD20 in the presence of a divalent cation that is preferably MG^2+. The cast lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-created lymphoma (NCL), immunocyton argade or follicular NHL, lymphocytic lymphocytic lymphoma, laukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytona (INC), small B-cell lymphocytic lymphoma, contacted with a cell to reduce OCC dargetting nucleic acid may be contacted with a cell to reduce NOCO gene in the presence of a divalent cation that is preferably MG^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOCO gene in the presence of a divalent cation that is preferably MG^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOCO activity of the cell and treat a patient having a condition associated with the level of NOCO. The treatment may further comprise the use of one or more central nervous system (CNS) injury and cerebrowascular accident contacted a disease, dementia, multiple sclerosis (MS), parknow's disease, muscular disease, ataxia, Huntington's disease, created because of the respondent of the nounberties of the respondent of the respondent of the nounberties of the respondent of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a nucleic acid molecule which down regulates expression of a curleic acid molecule which down regulates expression of a neurite growth inhibitor gene (Nacy). The regulates expression of a neurite growth inhibitor good). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a G-cleaver (cleaving RNA with an NCH motif), a G-cleaver (cleaving RNA with an NCH motif) a a manberzyme (cleaving RNA with an NCH motif), a clustoners (cleaving RNA with an NCH with an NCH color) in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (MLL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, leukaemia, and inflammatory arthropathy. The NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the contacted may be contacted with a cell to reduce NOGO gene in the call and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more contacted central nervous system (CNS) injury and cereborovascular accident (CVA, stroke), Allzheimer's disease, dementia, multiple sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, creative disease central response to the modulation of NOGO expression. The present cates which response to the nodo cates of creates which response to the nodo cates of cates with a response of cates of cates of cates which response to the nodo cates of cates of cates which response to the nodo cates of cates which response to the nodo cate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 89; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a neutite growth inhibitor gene (NGO). The regulates expression of a neutite growth inhibitor gene (NGO). The capulates expression of a neutite growth inhibitor gene (NGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a C-cleaver (cleaving RNA with a NYN motif) propered in amberzyme (cleaving RNA with an NYN motif) propered (cleaving RNA with an NYN motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic treat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HTV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MLL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphoma, immunocytoma (IMC), small B-cell lymphoma, immunocytoma (IMC), small B-cell lymphoma, immunocytoma (IMC), small a cell cation associated with the level of nucleic acid may be contacted with a cell to reduce NOGO activity of the cull and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more

ö
therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

                                                                                                                                                                                                                                                                                                                                                                                                          8
```

The invention relates to a nucleic acid molecule which down regulates

```
Complete and the mendolytic nucleic acid cleaving a an Kwa Maccule Complexing an NCD mocife), a closaving RNA with a NCH mocife), a closaving RNA with an NCH mocife), a closaving RNA with an NCH mocife), a closaving RNA with an NCH mocife), a closaving RNA with a NCH mocife), a closaving RNA with a NCH mocife), a closaving RNA with a CCD closaving RNA of CD20 in the presence of a divalent cation that is preferably MG^2/+.

Complete close in the presence of a divalent cation that is preferably MG^2/+.

Complete close in the presence of a divalent cation that is preferably MG^2/+.

Complete close in particular, the CD20 targetting nucleic acid may be used to the rapies. In particular, the CD20 targetting nucleic acid may be used to creat lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lenkaemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic lenkaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MC), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma (MC), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MC), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma (MC) immunocytoma (IMC), small B-cell lymphocytic lymphoma, indiced acid is used to cleave RNA of the NOGO gene in the cull and treat a patient having a condition associated with the level of CO presence of a divalent cation that is preferably MG^2+. Furthermore, the therapies In particular, the NOGO-targetting nucleic acid may be used to create central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic baterial sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic baterial sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic baterial sclerosis (MS), chemotherapy-induced neurop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a nRNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) property and NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA contracted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level coff CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lymphoma, lawphoma immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC) small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, lymphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC) small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHC, wantle cation that is preferably MG'2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGGO activity of the cargetic may be contacted with a cell to reduce NGGO activity of the NGGO. The treatment may further comprise the use of one or more theraphes. In particular, the NGGO-targetting nucleic acid may be used to theraphes. In particular, the NGGO-targetting nucleic acid may be used to the central network system (CNS) injury and cerebroorabcular accident
                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemcherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 4 A; 4 C; 4 G; 0 T; 5 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the invention

CHOWRIRA B M (MCSW/) CHOM/) Chowrira BM; Blatt L, Mcswiggen J,

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20.gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemla, and central nervous system injury.

Claim 88; Page 115; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NDGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a divalent cation that is preferably MG² +. Furthermore, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-flokin's lymphoma (MLL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG² +. Furthermore, the cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the call and treat a patient having a condition associated with the level of the cell and treat a patient having a condition associated with the level of the reatment may further comprise the use of one or more contral nervous system (CNG) injury and cereborovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, and/or bisease, created verther adisease, central nervous system (CNG) injury and cereborovascular accident central nervous system (CNG) injury and cereborovascular disease ataxia, Huntington's disease, central disease, central disease, ataxia, Huntington's disease, central disease, ataxia, Huntington's disease, ataxia, Hun

```
polymerase beta, which is a specific representation of DNA polymerase beta in oesophagus cancer. The protein coded by it has fully lost the DNA repair activity of DNA polymerase beta. It can be used for early diagnosis and gene therapy of esophagus cancer. This sequence represents a human DNA polymerase beta associated oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                  present invention discloses a cDNA sequence of human repair gene DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RNA inhibition, dsRNA1; gene expression inhibitor; oncogene; cytostatic; virucide; protozoacide; ds.

The protein coded by it has fully lost the DNA repair activity of DNA polymerase beta. It can be used for early diagnosis and gene therapy of esophagus cancer. The present sequence is a DNA sequence of the invention.

                                                                                                     The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1 has an overhang of 1-4 nuclectides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of a dsRNA molecule related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RNA inhibition; daRNA1; gene expression inhibitor; oncogene; cytostatic; virucide; protozoacide; ds.
               Inhibiting expression of target gene, useful e.g. for inhibiting oncogenes, by administering double-stranded RNA complementary to the target and having an overhang.
                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```

The invention relates to inhibiting expression of a target gene (I) in scell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least one end of dsRNA1

Claim 13; Page 40; 203pp; German.

ö
has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of

The invention relates to a novel isolated polypeptide (NOVX). A polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising Disclosure; SEQ ID NO 1454; 1880pp; English.

any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                              Gaps

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids an NCH motif), a G-cleaver (cleaving RNA with an NRY motif) propersessing an NCH motif), a G-cleaver (cleaving RNA with an NGN with a NGN motif) propersessing an NCH motif), a G-cleaver (cleaving RNA with an NGN with a call to reduce CD20 acivity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more corrected. The presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of fone or more therapies. In particular, the CD20 targetting nucleic acid may be used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the current lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCC) treatening and insection that is preferably MG<sup>2</sup>+. Furthermore, the creatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of theraphies. In particular, disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human spliced transcript detection oligonucleotide SEQ ID NO:5561.

messenger RNAs that populate a Genub-transcriptome, where the Genub-
transcriptome comprises messenger RNAs transcriptome, where the Genub-
transcriptome comprises messenger RNAs transcribed from multiple
transcriptom units that populate a genome. The library comprises several
oligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
oligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profiling studies, in qualitatively or
quantitatively characterising the corresponding transcriptome, and in
transcriptomes. The libraries may also be used as specialised mini
libraries to detect transcripts of a sub-transcriptome under a particular
biological or pathological state, and so allowing the detection of tissue
and pathology-specific genes such as those genes only expressed in
specific tissue under a specific pathological condition; to detect
developmental specific genes, and to detect RNA transcripts and splice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                 New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABNS9589 represent oligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                             The present invention describes oligonucleotide libraries for detecting

The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Herl) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriasis. They are also useful as research reagents, dismostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1
                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61.6%; Score 15.4; DB 6; Length 20; 76.5%; Pred. This insertion position refers to the first base of the 8 base target recognition sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Drosophila melanogaster (fruit fly)

Suchtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany
This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion close to or within gene At1g48930.

Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project.

GABI-Kat is part of the German Plant Genomics program designated thtp://www.mpiz-koeln.mpg.dGABI-Kat/.

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 was blunt end-repaired with T4 DNA polymerase and T4 polymerated kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to

/note="PCR was performed on DNA from Arabidopsis thaliana plants" PCR was performed on DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA from tragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed."

It indicates an insertion within the locus defined by BAC clone are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.
10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD4 [91]4732114 [91]47123104.], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X1.0-Gold (Stratagene) cells and selected for ampicillin resistance."

/clone lib="ASLV-vector integration sites in human 293T-TVA cells"

Lonce="Human 293T cells expressing the subgroup A avain retrovirus receptor (293T-TVA) were infected with an ASLV-based vector. DNA was isolated and cleaved with restriction enzymes; linkers were ligated onto the cleaved DNA and DNAs were amplified using one primer that bound to the linker DNA and one that bound to the ASLV cDNA. Junctions between integrated ASLV proviruses and cellular DNA were cloned and sequenced."

It indicates an insertion close to or within gene Atlg48900. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI Gor Plant Breeding Research in the context of the GABI-Kat project (GABI-Kat is part of the German Plant Genomics program designated 'GABI'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                     Laboratory Mouse DNA Resources (documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared but was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwb42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xi10-Gold (Stratagene) cells and selected for ampicillin resistance."
